

LINIUS CONTINUOUS LOUVRE SYSTEM

OUR MISSION

Creating healthy spaces

Paul Renson

"Renson" specialises in ventilation, sun protection and outdoor. With experience dating back to 1909, and an integrated team of over 1000 employees, we develop systems and solutions which provide consumers with a healthy and comfortable living and working environment, also taking into account energy efficiency and the use of renewable energy. We develop innovative products and systems, and offer total solutions to make every house into a healthy and comfortable home.

"We also appreciate the aesthetic values of every building, allowing our sun control and ventilation systems to be incorporated invisibly into your home. Our patio covers and aluminium blades for covering façades provide clear accents, offering added value to the architecture. Inside, we ensure that doors are integrated invisibly with no conspicuous frames or visible joints."

Discover how Renson® products can optimise the comfort experience while guaranteeing a contemporary design.

"We develop innovative products and systems allowing for aesthetic integration in every building."

PURPOSE OF THE CONTINUOUS LOUVRE SYSTEM (CLS)

The continuous louvre system consists of a support structure to which blades are fitted. The support structure carries the complete louvre assembly and is formed by vertically or horizontal placed mullions fixed by brackets at set distances. Depending on the structure, Renson® offers different mullion types. Blade supports are permanently fixed to the mullions allowing the blades to be clip-locked onto their supports. The method of construction is simple and well tested. Mitred corners, doors, vermin, bird or insect screens can all be incorporated. Depending on the application, different constructions are possible.

1. Screening

An application ideal for concealing unsightly equipment from view.

2. Ventilation

An assembly allowing the air flow in and out of a building whilst restricting the entry of rain. Here the CLS offers by far the best aesthetic solution.

3. Screening against the weather

The continuous louvres system protects your installation from wind, rain and vermin.

4. Acoustics

Fitted with acoustic blades, the CLS is ideal for the screening of noisy installations. The structure of the louvres system together with the noise damping qualities ensure that noise is strongly damped, while keeping good ventilation.

5. Aesthetic cladding

Applications in which the blade profile design is preferred to other applications.

6. Interior

Interior cladding, possibly incorporating back lighting.

SELECTION CRITERIA

This chapter offers you assistance in selecting the ideal Renson® louvre ventilation system. Some definitions well-known in the field of natural ventilation are explained.

If the CLS is only used for aesthetic reasons, the theoretical values calculated using the formulas below can still provide an added value.

A. Visual distance between 2 blades
B. Narrowest opening between 2 blades
C. The pitch of the blade

GEOMETRIC TERMS

VISUAL FREE AREA^(*) = The visual free area is determined by the ratio between the visual distance between two blades [A] and the pitch of the blade [C].

PHYSICAL FREE AREA^(*) = The physical free area is determined by the ratio between the narrowest opening between two blades [B] and the pitch of the blade [C].

^(*) Both definitions of the free area do not take into account the influence of top and bottom blades.

AIRFLOW TERMS

K-FACTOR = The K-factor is a value describing the aerodynamic resistance to air flow.

Contrary to the free area it describes the relationship between the air flow through the louvre and the pressure drop over it. For exact interpretation purposes, the calculation is explained step by step below.

To find the resistance to air flow due to the insertion of a louvre into an opening, a K-factor must be used. This factor is determined by trial and error. Where specific volumes or air speeds are required, one can better not use the free area to calculate the drop of pressure over or the size of the louvre.

Renson® recommends the use of K-factors which are established by the actual testing of a louvre. Blades with the same free area can have different K-factors. This is caused by small differences in the shape of the profiles [e.g. different blade gradient, different shape of the edges of the blades, etc.].

The free area must be used in cases where the open part of the CLS must be equal to a certain percentage of the floor surface.

C_e = Entry loss coefficient = a value describing the aerodynamic channelling of the airflow on entry. This value represents the ratio of the actual airflow to the theoretical airflow.

C_d = Discharge loss coefficient = a value describing the aerodynamic channelling of the airflow on discharge. This value represents the ratio of the actual airflow to the theoretical airflow.

Before one can determine the pressure drop one must determine the air speed using the following equation:

$$\text{Air speed} = \frac{\text{FLOW RATE}}{\text{SURFACE}} \text{ [a]}$$

Flow rate = m³/s the volume of air passing through the CLS
 Surface area = m² the size of the louvre (front view)
 Air speed = m/s the speed of the approaching air at the front of the CLS. [This is the result of a certain volume passing through the CLS.]

If two elements are known in this equation, one can calculate the third.

$$\text{Pressure drop} = K \times 0,6 \times \text{Air speed}^2 \text{ [b]}$$

One can transpose the equations to determine dimensions, air speeds or pressure drop.

Link between K-factor and c-coefficient:

$$K = \frac{1}{C^2}$$

USE OF THE K-FACTOR METHOD

METHOD 1: identify suitable louvre type for a certain opening size

1. Determine the required air flow rate
2. Determine the available opening (size of the louvre)
3. Determine the maximum permitted pressure drop
4. Choose the appropriate louvre type based on the K-Factor

EXAMPLE OF METHOD 1

Which type of louvre is suitable to achieve the desired ventilation volume of 55,000 m³/h with a maximum pressure drop of 25 Pa and an opening of 10 m²?

Calculation:

Calculation formula [a]
 Flow rate = 55000 / 3600 = 15,28 m³/s
 Size of the louvre = 10 m²

$$\text{Air speed} = 15,28 \text{ m}^3/\text{s} / 10 \text{ m}^2 \\ (\text{surface area}) = 1,53 \text{ m/s}$$

Calculation formula [b]
 Pressure drop = 25 Pa
 Air speed = 1,53 m/s

$$\text{K-Factor} = 25 / (0,6 \times 1,53^2) = 17,80$$

This is the maximum K-value to achieve the desired volume with a certain pressure drop and size. Blade types L.050, L.050HF, L.060AC, L.060HF, L.065, L.066, L.075, L.095 and L.120 can be recommended. The final choice depends on personal preference.

METHOD 2: determine required louvre size when louvre type is already chosen

1. Choose preferred louvre type
2. Determine the air speed at the face of the louvre by means of the K-factor and the maximum pressure drop
3. Determine the required air flow rate
4. Determine the minimum louvre size

EXAMPLE OF METHOD 2

Blade type L.050.00 is preferred by the architect. What size is required to achieve a maximum pressure drop of 30 Pa for a given flow rate of 10,000 m³/h ?

Calculation:

Calculation formula [b]
 K [L.050.00] = 12,57

$$\text{Air speed} = \sqrt{\frac{30}{0,6 \times 12,57}} = 1,99 \text{ m/s}$$

Calculation formula [a]
 Flow rate = 10.000 / 3.600 = 2,78 m³/s

$$\text{Surface area} = \frac{2,78 \text{ m}^3/\text{s}}{1,99 \text{ m/s}} = 1,39 \text{ m}^2$$

This is the minimum surface area of louvre type L.050.00 needed to obtain a pressure drop of less than 30 Pa at a flow rate of 10,000 m³/h.

ACOUSTIC TERMS

dB[a] = the decibel [dB] in this brochure is used to characterize the noise reduction of a louvre. The A-weight [dB[a]] shows that the acoustic tests have been taken out according to the sensitivity of the human sound spectrum.

R_w [C;C_r] = weighted sound reduction index, used to characterise glazing, brick walls, wall louvres, etc.

C = spectrum correction term for pink noise, always added to R_w when the source of the noise is, for example, fast-moving traffic.

C_r = spectrum correction term for traffic noise, always added to R_w when the source of the noise is, for example, urban traffic.

Frequency = pitch expressed in Hertz [Hz], or the number of vibrations per second.

WATER PENETRATION TESTS

THE PRINCIPLE

The Renson® louvres were subjected to tests according to EN13030:2001 in Great Britain by BSRIA, a body accredited worldwide.

A wall of 1 m², possibly fitted with a stainless steel 304 mesh, was tested in torrential rain with a capacity of 75 litres/hour and a wind speed of 13 m/second. The weather performance class table is drawn up depending on the results obtained, i.e. the quantity of water passing through the louvre.

WITHOUT WATER CHANNEL

Test of a standard CLS

WITH WATER CHANNEL

Test of a CLS with mesh and sill

	Class	% watertightness	Suction air resistance class [C_e -coefficient]
Very good rain protection	A	100 - 99	$C_e > 0,4$: 1
Good rain protection	B	98,9 - 95	$0,3 < C_e < 0,4$: 2
Average rain protection	C	94,9 - 80	$C_e : 0,2 - 0,299$: 3
Low rain protection	D	< 80	$C_e < 0.199$: 4

Linus® L.033.01

L.033.01

Extruded aluminium blade

Extruded aluminium profile for light duty with a 33.3 mm pitch. Normally used for smaller surface areas.

MATERIALS

Aluminium extrusion, alloy EN AW 6063 T66

FINISH

- Anodised [20 micron]
- Polyester powder coating RAL or Syntha Pulvin colours [60 - 80 µ/40 µ (UK)]

MESH

Fixed to rear of the support structure or in combination with blade L.033IM1.

FEATURES

Blade L.033.01 can also be curved with a minimum radius of 800 mm [see p. 111]. Top blade L.033.02 available for attractive top connection. Long bottom blade L.033.03 and short bottom blade L.033.04 for optimal finish.

DOORS

Single and double doors available with standard Renson® hardware and rotating on pivot [see p. 106]

BLADE SUPPORT

- Single blade support: type L.033.11 [width: 30 mm]
- Double blade support for thermal expansion: type L.033.12 [width: 34 mm] [connecting piece for 2 blades]

L.050W / L.050WV / L.050WS

Extruded aluminium blade

L.050W

L.050WS

L.050WV

L.050W

The new patented system Renson® Linius L.050W is an aesthetically elegant high performance louvre. The system consists of water-resistant blades which have been tested up to 3.0 m/s according to performance class A2 [L.050WV: class A2 to 4,0 m/s]. They are easy to install and barely visible, thanks to being clip mounted to blade supports which accompany the system. Other unique features of this system include excellent air flow, a good physical free area and the blade's large unsupported span between two mullions. This system L.050W can be provided with an optional frame profile L.050W.23 - see Aluminium frames.

L.050WS

To provide a matching aesthetic blade, the L.050WS blade is available as part of the system. The blade can be used for non active areas or where high performance without weather resistance is required. Visually the two systems appear the same.

MATERIALS

Aluminium extrusion, alloy EN AW 6063 T66

End cap L.066P.13 in black or grey PVC

BLADE SUPPORT

- Single blade support: L.066P.11 [width: 28 mm]
- Double blade support for thermal expansion:
L.066P.12 [width: 34 mm] [connecting piece for 2 blades]

APPLICATIONS

- Sunshading blades
- Visual screen
- Aesthetic cladding
- Both exterior and interior applications
- Room divider
- Ceiling covering

TECHNICAL DATA

L.066P	
Pitch	66 mm
Depth	53 mm
Height	15 mm

Visual free area*	77 %
Physical free area*	77 %
Max. unsupported span between two mullions**	800 mm

* Definition see p. 6

** At q_p 800 Pa wind pressure

TECHNICAL DRAWINGS

L.075

L.075W

Extruded aluminium blade

L.075W

The new weaterable blade L.075W is tested according to EN13030:2001, BSRIA certificate available. With class A2 at a wind speed of 13 m/second and a suction air velocity of 0 m/s, this blade is is particularly appropriate for air discharge applications requiring water resistance. Blades with a pitch of 75 mm, for simple and invisible assembly by clipping the blades into het blade supports included in the system.

MATERIALS

Aluminium extrusion, alloy EN AW 6063 T66

FINISH

- Anodised [20 micron]
- Polyester powder coating RAL or Syntha Pulvin colours [60 - 80 µ/40 µ [UK]]

MESH

Fixed to rear of the support structure.

BLADE SUPPORTS L.075W

SUPPORTING STRUCTURES

A system consisting of extruded aluminium mullions on which the blade supports and blades are fixed.

The fully homogenous structure is designed according to CEN/TC 250/SC9 Eurocode - 9/BS8118 for the structural use of aluminium. The fitting of the mullions is determined in accordance with CEN/TC 250/SC1 Eurocode 1/BS, section 3 and good craftsmanship.

The blades click tight onto the blade supports. The choice of the pitch and other aspects is based on the data described on page 98. The various options of doors, mitred corners and acoustic elements can be selected and integrated in the design.

The complete supporting structure is prepared for the fastening of the blade supports. Fastening can already fully take place at the factory or be partly left for assembly on the site. With the last option one has the flexibility to fasten the last blade supports on site and cut the mullions to size for a perfect installation.

OVERVIEW

SUPPORTING STRUCTURES

SUPPORTING STRUCTURES LINIUS						
Mullion	LD.0065	LD.0070	LD.0195	LD.0240	LD.0440	
Application	Extruded aluminium profile for continuous support, directly assembled on an existing wall or steel supporting structure.	Extruded aluminium profile for continuous support, directly assembled on an existing wall or steel supporting structure.	Extruded aluminium profile for limited vertical span, directly assembled on an existing wall or steel supporting structure.	For lateral fixation of insect mesh.	For constructions and sideways fixation.

FIXING BRACKETS

The Linus mullions are fixed to an existing structure by means of specific brackets. Using brackets type LZ.4206, LZ.4209, LZ.4210 and LZ.4211 of the standard Renson® product range, assembly of the mullions is easy in most situations.

The corners LZ.4203 and LZ.4209 are assembled on the rear of the mullions by means of clamping pieces LZ.4202 or LZ.4211. These parts have a thread or press bolt, which allows them to be fixed at any height to the support structure.

The LZ.4206 bracket slides into the rear of the supporting sections and can move freely in these profiles. A fastening point with this bracket guarantees horizontal stability but allows vertical movement due to thermal expansion. Mounting bracket LZ.4210 is used for wall mounting or ground mounting.

The type of bracket and the amount needed depends on the properties of each type of mullion.

Fixing brackets LZ.4202 and LZ.4211

Type LZ.4202

Type LZ.4211

Type LZ.4206

Angle bracket LZ.4214

FIXING BRACKETS

Angle bracket LZ.4203 and LZ.4209

Where necessary, project specific brackets can be designed and provided by a Renson® approved manufacturer/installer.

ACCESSORIES

MESH

Renson® offers various types of mesh to prevent the entry of insects, birds or vermin behind the continuous louvre system.

1. THE MESH CAN BE RIVETED TO THE REAR OF THE CLS BY MEANS OF A FLAT PROFILE.

Various types mesh of stainless steel 304L of different sizes are available on rolls:

2. SUPPORT LD.0240 FOR LATERAL FIXATION OF MESH

3. THE MESH CAN BE CLIPPED BETWEEN TWO BLADES. THIS IS POSSIBLE WITH BLADE TYPE L.095

For blade type L.095.01, there are 2 types of meshes:

- Dense sheet (BOP) L.095.31
- Bird mesh L.095.33
 - K-Factor = 15,38
 - Physical free area = 42%

4. LOCKING TOOLS

Due to thermal dilatation, aluminium blades might start moving in the course of time. In order to avoid this, the blades can be locked by means of a locking tool. This tool is available for blades type: L.033.01, L.033CL, L.050HF, L.050CL, L.050W, L.060HF, L.066.01, L.066.06, L.066CL, L.075W, L.075HF, L.095 and L.120.

5. UNCLIPPING TOOL

If blades are to be removed, the blade removing tool can be used. This blade removing tool is available for L.050.00, L.050HF, L.060HF, L.066.01, L.075.01, L.075HF and L.095.

SILLS

A sill (type LZ.4140) can be fitted in the CL S to drain rain water off.

Fastener for a sill type LZ.4201

Instead of a sill, a frame can be used for the L.075 system [see page 104].

ALUMINIUM FRAMES

L.050W

L.050WV

L.050W/ L.050WV

The high performant system L.050W can be provided with an optional frame profile L.050W.21 which will result in an ideal water drainage. This frame profile will be installed both horizontally and vertically around the wall opening and is used in combination with mullion profile LD.0460. These mullion profiles LD.0460, with pre-assembled clips L.050W.11, are to be installed onto structural mullions [type Renson® or a structural sub-structure] and provided with stainless steel mesh. In this way incoming water is drained back to the outside.

L.050W

L.075W

The louvre system type 75 has been designed with the option of being provided with a frame with or without flange.

The design with flange gives the aesthetically attractive appearance of a continuous blade surface. A sealing rubber can be used to give the louvre a perfect finish so use of silicone putty is unnecessary.

LZ.4207: Corner trim connector
LZ.4208: Intermediate trim connector

L.075W

DOORS

Renson® offers single or double doors in custom made sizes, opening inwards or outwards. In some cases, access behind the continuous louvre system is required, for example to maintain and service [hidden] industrial appliances. The doors are fitted with locks, pivots, handles and restraining chain upon specification.

DIFFERENCE BETWEEN OVERALL SIZE [O] AND CLEAR DOOR OPENING [C]

Blade type:	L.033 / L.033.08		L.033V		L.050 / L.050HF		L.060AC / L.060HF		L.065AL		L.066 / L.075HF	
O - C [mm]	single	double	single	double	single	double	single	double	single	double	single	double
Opening outwards	259,5	399	259,5	399	259,5	399	279,5	439	259,5	399	259,5	399
Opening inwards	218	-	237	-	238,5	-	275,5	-	246	-	252,5	-

Blade type:	L.066P		L.066V		L.095		L.120		L.150ACS	
O - C [mm]	single	double	single	double	single	double	single	double	single	double
Opening outwards	259,5	399	259,5	399	279,5	439	309,5	499	539,5	959
Opening inwards	252,5	-	246	-	275,5	-	288	-	365	-

Please note that the actual opening [C] is smaller than the total door size [O] due to the pivoting mechanism. The position of the pivot system will in turn depend on the total load of the louvre door. Renson® can assist you in determining the correct sizes.

HANDLES AND LOCKS

One can choose between none, a single or a double door handle. If you choose not to fit a door handle you can open and close the door with the key to the lock. The handle can be a fixed door knob or a standard handle. It is important to specify the handle type.

The Litto cylinder is the only approved option. Other proposals can be considered if full technical data is provided to Renson®. Other types are available on request.

Accessories such as door dampers, storm chain,... are available on request.

SPECIALITIES

LINIUS® - UNITIZED SYSTEM

Lever

Lifting eye

Innovative products are always challenging in terms of design, technique, flexibility and quality! To save valuable time in the assembly process on site, Renson® developed the Linius unitized system. The advantage of this system is that it allows an entire louvre system to be divided into modules, which arrive on site in pre-assembled condition. Upon installation of the mullions on site, successive cassettes can be easily and quickly installed using a clasp system.

BENEFITS

- Delivered as pre-assembled cassettes, hence:
 - Quick installation, using clasped blades and simple clasping system
 - Simple installation and alignment
 - Easy assembly in hard-to-reach areas, e.g. high installations, only accessible from the interior ...
- Elements with invisible, encompassing frames
- Removable cassettes, e.g. machine areas
- Reclining elements possible
- Available with enfolded stainless steel mesh
- Elements for mitred corners possible
- Aesthetic appearance, solid and stable system

PROPERTIES

- Max. dimensions: 4m² per element – 9 to 16kg/m²
- Cassette layout optional according to grid
- All Linius® range blades are suitable
- Assembly using lever for smaller cassettes
OR using hoisting eye for larger cassettes and for high installations (crane)
- Technical documentation available

MATERIALS

Aluminium extrusion, alloy EN AW 6063 T66.

FINISH

- Anodised [20 micron]
- Polyester powder coating RAL or Syntha Pulvin colours [60 - 80 µ/40 µ [UK]]

MESH

Enfolded assembly of stainless steel mesh to the back of the cassettes

CURVED BLADES

Today's designs often call for expressive forms giving a building a specific look. Renson® has developed a curved assembly system that allows the architect's creativity to be transformed into reality.

Blade types L.033.01, L.033HF, L.050.00 and L.050HF can be delivered with an minimal outer radius of 800 mm.

In addition, blade types L.033.01 and L.050.00 can also be curved with a minimal inner radius of 800 mm.

Plans for such a curved design must be submitted to the technical department at Renson® for approval before the start of the construction process.

STAND ALONE SUPPORT STRUCTURES

This system is used for freestanding louvre systems of limited sizes and/or wind loads where an additional primary steel structure is rendered unnecessary by a self-supporting aluminium structure.

ACOUSTIC APPLICATIONS

Noise nuisance is an environmental pollutant. We at Renson® are fully aware of this. As a solution, Renson® offers an acoustic louvre that reduces noise pollution and complies with existing regulations.

This acoustic louvre system allows air passage while reducing noise passage. The Renson® technical department is at your disposal to advise and discuss a suitable acoustic construction.

In order to determine the ideal solution, the following factors are important:

- the desired dB noise level
- the noise level of the noise source
- the distance and location of the noise
- the required flow rate

The acoustic continuous louvre system consists of a support structure, acoustic blades and blade supports.

The acoustic blade is filled with sound absorbing and non-combustible mineral wool.

See pages 42, 72 and 78.

MITRED CORNERS

Where a corner is formed, the blades are cut to the correct angle so they fit perfectly and ensure an attractive aesthetic finish.

POSSIBLE SOLUTIONS TO FIT CORNERS

SPECIAL SHAPES

Renson® long ago moved on from the limits of a simple square design, and has continuously conceived solutions for specific applications. These are applications mainly intended to create a certain aesthetic added value, but also applications where functional requirements must be combined with a contemporary design.

BLOCK BLADES L.033 AND L.050

This type of blade offers fast and easy assembly and better vandalism-resistance than the standard aluminium CL S. The blades can only be used for riveting or screw-fixing to an existing full back structure (wall, metal sheeting, ...).

The extruded profiles are only available in types L.033 or L.050.

They consist of 3 to 4 blades extruded together. The profiles are available as punched [L.033.07 / L.050.07] or unpunched [L.033.05 / L.050.05] versions. The block blades can be used in conjunction with the standard blades.

Block blades

TURRETS

A turret is placed on the rooftop of buildings to conceal industrial appliances. [chimney stacks,...]

Renson® takes care of complete construction including the top plate and sill.

LOUVRE GRILLES

Linus CLS blades can also be used for assembled made-to-measure louvres. These louvres are made of frame profiles for building in or surface mounting, filled with a blade type depending on passage or aesthetic requirements, optionally fitted with a stainless steel insect mesh. The louvres grilles and louvre system can then be aesthetically matched. Louvre grilles are available in all forms, sizes, RAL colours, and as permanent or lockable versions. Louvre grilles with moving blades, sliding panels, or fixed or removable surface-mounted grilles for windows are also available.

SYSTEM	BLADE	BLADE TYPE	PITCH	GRILLE
L.033	L.033.01	Standard blade	33,3mm	411 ; 414 ; 414D ; 414VA ; 414THF ; 431 ; 432 ; 440/11
L.033.08	L.033.08	Labyrinthe blade	33,3mm	491 ; 494
L.033V	L.033V	V-blade	33,3mm	422 ; 428
L.050	L.050.00	Standard blade	50mm	421 ; 424 ; 440/21
L.050HF	L.050HF	Blade with large free area	50mm	481 ; 484
L.050W	L.050W	Weatherable blade	50mm	450
L.060AC	L.060AC	Acoustic blade	60mm	445/86 ; 445/86GL
L.060HF	L.060HF	Blade with large free area	60mm	480 ; 483
L.065AL	L.065AL.01	Rolled sheet blade	65mm	453
L.066	L.066.01	Standard blade	66mm	451
L.066V	L.066V	V-blade	66mm	452 ; 452V
L.075W	L.075W	Weatherable blade	75mm	475 ; 475GL
L.075HF	L.066.01	Standard blade	75mm	457
L.095	L.095.01	Standard blade	95mm	425 ; 425GL
L.150ACL	L.150ACL.01	Acoustic blade	150mm	446/225
L.150ACS	L.150ACS.01	Acoustic blade	150mm	446/150
L.170ACL	L.150ACL.01	Acoustic blade	170mm	447/225
L.170ACS	L.150ACS.01	Acoustic blade	170mm	447/150

AESTHETIC FAÇADE CLADDING WITH SUNCLIPS® AND ICARUS® BLADES

Besides the range of louvre systems, Renson® also offers a whole range of aluminium profiles suitable for sunshading structures.

One of the systems can be vertically fitted to act as a louvre. This structure is mainly intended for purely aesthetic applications and/or sunshading.

STORAGE AND MAINTENANCE

CARE OF EQUIPMENT AND MATERIALS

To avoid deformation of blades etc. it is imperative to use 'soft handling' methods to unload and store materials. Deliveries on pallets may never be stacked more than two high to minimise exposing others on the site to risk.

To prevent damage during storage, handling or delivery one must comply with the following rules:

- the products are preferably stored inside.
- with open outside storage, remove the packaging to prevent the entry of water and any overheating.
- never place the elements directly on damp ground.
- during storage one must guarantee sufficient ventilation of the elements.
- soiling by cement, mortar or lime must be immediately removed with plenty of clean water.

Make sure that nearby material or installations cannot accidentally fall against the boxes and cause damage. The components are packed in wooden crates to protect them against damage. Packages and boxes are labelled with the content. The label has a bar code with the internal computer system reference. Where possible the link is made with the production drawings that can be sent with the goods.

Deliveries are planned so the correct material arrives in the correct place in the preferred order of use!

INSTALLATING DOOR ELEMENTS

- For ease of transport, the leaves for large or double doors may be delivered loose. Fitting and removing door leaves: see "Instructions for assembly"
- In order to ensure that the blades in the CLS and those on the door are in line and so maintain the linearity of the louvre, it is recommended to first put the door element in place and only then to locate the support structures next to that element.
- They must be installed perfectly vertically on both sides to be sure the door will work properly. It is also very important for the batten at the base of the frame (and the pivot, especially) to be fully supported.
- It is fitted using brackets from Renson® and anchoring materials specified and supplied by the installer.

INSTALLING INSECT, BIRD OR VERMIN MESH (OPTIONAL)

- PVC strips clipped between the blades after blade installation. These strips are available for blade L.095.01.
They are clipped in place by the lip of the blade.
- Stainless wire mesh V2A in 2.3 x 2.3 mm, 6 x 6 mm, 10 x 10 mm or 20 x 20 mm mesh (supplied on roll).
The mesh is fixed to the substructure or the support structures.
Suggestion: First attach an angle bracket to the support, then use a plate to bolt the mesh to the bracket.

INSTALLATION OF THE CONTINUOUS LOUVRE SYSTEM

Thermal dilation

When planning and assembling the strip wall system and the dilation joint, the thermal expansion of the aluminium must always be taken into account. The thermal expansion coefficient of aluminium is 0.024 mm/mK (which is approximately equivalent to expansion of 1 mm/m with a rise in temperature of 40° C). In the event of major temperature fluctuations, the possibility of the harmless thermal expansion causing cracking sounds cannot be discounted.

To prevent that from happening as much as possible, it is important for the support profiles to which the strips are being attached, to be installed well in line and perfectly plumb. We also recommend using shorter strip lengths so that the total dilation per profile is kept to a minimum. Selecting the power-coated version also reduces that risk of dilation noise.

Positioning and aligning support structures

- The following points must be taken into account when planning and before ordering a CLS:
 - the maximum allowable separation between the support structures is a function of the type of blade and support structure, and the local wind loading.
 - the vertical clearance between two attachment points is a function of the type of support structure, the clearance between two support structures and the local wind loading.
For more details, see the Renson® louvre documentation.
- Align the support structures with prefitted blade supports laterally such that the blade supports are all at the same height.
Use suitable equipment such as a laser, cord, etc. to achieve this.

If the height of the supports varies, the blades will not be even and the wall will lose its linear appearance.

If the differences are large, the blade will not clip into the blade support.

Installing support structures at expansion joints

When installing aluminium systems, always allow for the thermal expansion of aluminium.

Its coefficient of thermal expansion is 0.024 mm/mK. To avoid blocking the expansion of the strips after assembly, you can choose from 2 possible methods at the level of the strip joints.

- **Option 1: Installing support structures with double blade support for two blades (type L.XXX.12)**

- **Option 2: Option 2: Installing two separate support structures with prefitted standard blade supports (type L.XXX.11)**

CLEANING FREQUENCY

Aluminium elements exposed to regular rain and installed in a neutral atmosphere require thorough cleaning once or twice a year. Aluminium components situated in an urban or industrial environment need to be thoroughly cleaned at least twice a year. For coastal areas or areas with a strongly polluted atmosphere this frequency should be increased. Components not exposed to rain must be cleaned more frequently.

Further and more detailed information for installation are available on our website www.renson.eu

Summary of Renson® Linius continuous louvre system

PRODUCT DESCRIPTION:

Renson® Linius CLS consists of sections of extruded ALMgSi0.5 aluminium with a surface treatment specified by the architect. The system consists of water-resistant ventilation blades, for simple and invisible assembly by clipping the blades into the blade supports included in the system

STANDARDS:

- Aluminium alloy: Al Mg Si 0,5 [F25]
 - Standard: EN AW-6063
 - Annealing: T66
- Strength calculations based on the following standards:
 - ENV 1999-1-1: calculation for aluminium structures
 - NBN B-03-002-2: wind load - dynamic effects
 - EN 1991-1-4: wind load

SURFACE TREATMENT:

- Anodised in natural colour F1 [20 micron]: pre-treated and anodised
- Powder-coated in RAL colours [60 to 80 micron]: aluminium profiles are pre-treated to ensure a firm powder coating, and then powder-coated

SYSTEM DESIGN:

- BLADES:
 - Blade type L of extruded aluminium
 - Dimensions: Height:
Depth:
Pitch:
 - Invisible assembly by clipping the blades into the corresponding blade support L11 and L12 [joint clips]
 - Drag coefficient: C_{fy} [determined using wind tunnel tests]: [horizontal direction]
 C_{fz} [determined using wind tunnel tests]: [vertical direction]
 - Visual free area:
 - Physical free area:
 - K-factor:
- SUPPORT STRUCTURE
 - Support profile LD..... of extruded aluminium:
 - Dimensions: Height:
Depth:
 - Minimum moment of inertia $I_y =$ mm⁴ [at 800Pa wind load]
 - Blade clips are pre-assembled onto support profile
 - Fixing brackets LZ:l
- SPAN:
 - Maximum unsupported span of the said system, at $q_p = 800$ Pa wind load:
Blade:
Support profile:
- SYSTEM DEPTH:
 - Blade and support profile:
- ACCESSORIES:
 - Encompassing frame L.075.21 with flange or L.075.22 without flange.
 - Enrollable rubber seal L.075.41 for frame profiles L.075.21; L.075.22
 - Corner trim connector LZ.4207 and intermediate trim connector LZ.4208 for frame profiles L.075.21 ; L.075.22
 - PVC -strips L.31, L.32, L.33 or L.34 clicked between the blades - assembly from front possible
 - Stainless steel 2.3 x 2.3; 6 x 6 or 20 x 20 mm mesh, attached to the back of the support structure
 - Sill profile LZ.4140 and bracket LZ.4201

[Please strike out whichever is not applicable]

EXPERIENCE, INNOVATION & TECHNOLOGY @ RENSON

WE'D BE HAPPY TO HELP YOU!

Our head office - the elegant building designed by the late architect Jo Crepain, which has been the visiting card of our company for many years now - is now being renovated. The bottom part of the building now has an imposing glass façade. Behind the façade, there is a new 'Customer Centre' with reception rooms for customers, conference rooms, and an auditorium, where large groups of more than 300 people can participate in presentations. In case of smaller groups, this auditorium can also be divided into 3 separate rooms.

The highlight of the project is the new showroom of 1250 m², where professional customers as well as private individuals can be accommodated. Apart from a showroom for Renson's various innovative solutions and concepts, it is planned to make this room a knowledge centre, where customers can walk in and ask questions about ventilation, heating, sun protection, ventilative cooling, acoustics, interior, etc, In short: everything to provide the home with all the necessary comfort. There is also the possibility to view the solutions in practice in show houses located nearby.

For more information about the network of Renson® ambassadors, please visit our website at: www.renson.eu

RENSON®: YOUR PARTNER IN VENTILATION, SUN PROTECTION AND OUTDOOR CONCEPTS

Creating healthy spaces

From 1909, we've been developing energy efficient solutions assuring a healthy and comfortable indoor climate. Our headquarters - built according to the 'Healthy Building Concept' - is a beautiful example portraying our corporate mission.

No speed limit on innovation

A multidisciplinary team of more than 90 R&D employees continually optimize our products and develop new and innovative concepts.

Strong in communication

Contact with the customer is of the utmost importance. A group of 100 in-the-field employees worldwide and a powerful international distribution network are ready to advise you on site. EXIT 5 at Waregem gives you the possibility to experience our products on your own and provides necessary training for installers.

A reliable partner in business

We can guarantee our customers optimal quality and service thanks to our environmentally friendly and modern production sites [with automated powder coating line, anodisation line, uPVC injection molding machinery and mold making shop] covering an area of 95.000 m².
